

Full Chat-to-Document

The same source conversation → a coherent standalone working document

BEFORE

Same raw Pepper Riot chat

- “Three sauces maybe...”
- “Maybe 12 each.” → “Too much.” → “Six each for now.”
- “Bottle cost... around a dollar... do not put \$1 down like it is fact.”
- “Pepper Riot is fun.” → “Current favorite, not final.”
- “Price maybe \$8.” → “I am guessing...”
- “Do not answer now. Put it on the research list.”

...and several decisions, reversals, assumptions, and deferred items.

AFTER

PEPPER RIOT Farmers Market Validation Plan

- Executive Summary**
Test a three-flavor line through Austin-area farmers markets before larger inventory or infrastructure. First batch: 18 bottles. Working pre-market ceiling: \$150.
- 1. Validation Objective**
Can it legally be sold? Is there a practical venue? Can it be produced economically? Is there enough customer interest?
- 2. Product Concept**
Mild Green • Smoky Red • Hot. Recipes need standardization; missing details are not inferred.
- 3. Financial Framework**
\$8 retail, \$2 ingredient cost, and ~\$1 bottle cost remain unverified. Test recipes should produce actual cost data.
- 4. Decision Gates**
Proceed only when feasibility, unit economics, and market access are sufficiently known.
